Activity
Skiing

Observed a D1 Natural wet slab avalanche in the Playground, just North of Texas Meadows. It seemed to have been triggered from a wet loose avalanche that released from the cliffband above. Estimated that the avalanche occurred on 3/22 during the period of warming after the snow tapered off. Crown was estimated at 1.5-2', approximate slope angle 35-40 degrees, E-SE slope, debris was 4-5' deep. Slide ran approximately 275'. HS just below the toe of debris was 115cm.

Also observed wet loose activity in S facing run off Texas (first run to the W of the summit)-photo attached.

Region
Bridger Range
Location (from list)
The Playground
Observer Name
Dan Sandberg
