Windy day for a Mt. Blackmore summit

Date
Tue, 12/10/2024 - 17:40
Activity
Skiing

Summited Mt. Blackmore 12/10. High wind and heavy wind loading were found, but minimal signs of instability were found within the wind-loaded areas. Some localized cracking and collapsing were observed throughout the boot pack but had minimal propagation. Before the climb, we performed an ECT on a wind loaded slope and found inconclusive results with ECTX.

Region
Northern Gallatin
Location (from list)
Mt Blackmore
Observer Name
Kaden Johnson
