

Poor test scores and whumpfs in Specimen

Date

Thu, 02/02/2023 - 16:45

Activity

Skiing

Just wanted to report that I found very thin snow on west aspects in Specimen Creek, with unstable test results today.

Had an ECTP 13 down about 20 cm on the new/old snow layer from last weekend. Couple whoomphs, and observed some stiff WS formation on ridge lines. HS of 90cm and absolute junk on the bottom.

Great skiing on non-avalanche terrain, however.

Region

Southern Gallatin

Location (from list)

Specimen Creek

Observer Name

Matt Standal
