

From obs 2/26/23: "We triggered and were caught in an avalanche very near town. We skied the east side of Miller, dropped down to descend the very eastern slope just above town. While standing on approximately a 30-35 degree slope we experienced a release immediately above us. The crown line was approximately 18-24" and extended appx 50' across. We were caught for about 150' before coming to a stop and buried to the thigh. The entire slide was appx 400' from top to bottom. It was appx a D2."
