Collapse in Cooke

Republic Creek Cooke City 2/5/2024 Code Latitude 44.98550 Longitude -109.94100 Notes

We skied south of Cooke City and dug a <u>snowpit</u> at 9,761' on a west facing slope. We had an ECTP21, 40 cm below the surface (16" down). There was 6-8" of new snow from the weekend above 4" of soft old snow, on top of 4" of a pencil- hard <u>slab</u>, then the soft sugary facets to the ground. ECT broke below the hard <u>slab</u> at the top of the facets (photo). I had one <u>collapse</u>, 10-12' wide near treeline where there was little more wind-<u>loading</u>/effect (photo).

The unstable test score, very poor snowpack structure, and $\underline{\text{collapse}}$ indicate a person could easily $\underline{\text{trigger}}$ a large avalanche on steep slopes.

Snowed lightly on and off all day with a couple cm accumulation. Wind was light-moderate out of the southwest with mostly overcast skies.
