

Cooke City Observations 04/10

Date

Wed, 04/10/2024 - 15:30

Activity

Skiing

From email: "Had [propagation](#) on 1.5mm rounding facets below the mid-March, 1/2cm thick and knife hard MF crust. This location is always shallow and has a poor structure, but I was surprised to get [propagation](#).

Further up valley on a west [aspect](#), HS 130, 1 of 2 pits had ECTP28 on the basal facets. Pretty wild to still be getting [propagation](#) in mid April.

Winds were light out of the south, gusting to strong at ridgetops out of the west with active snow transport. No wet loose activity seen today, but several old wet loose avalanches on Climax from the last warm up. "

Region

Cooke City

Location (from list)

Hayden Creek

Observer Name

Nina Hance
