

Large avalanche in northern Gallatin

Date

Sun, 05/05/2024 - 12:50

Saw a very large crown on a north face of a peak west of the hyalite area. Potentially peak 9662. The crown appears to wrap around multiple aspects for about 1/4 mile. Seen from the Bridgers around noon on May 4th. Probably went during this weeks storm, but it looks to me like it was much deeper than a storm slab.

Region

Northern Gallatin

Location (from list)

NORTHERN GALLATIN RANGE

Observer Name
