

Shooting Cracks on Blackmoore

Date

Sun, 02/02/2025 - 13:00

Activity

Skiing

Good mellow dust on crust skiing with 1"-3" of poorly bonded new snow. Widespread shooting cracks observed on new snow interface on all aspects traveled through the day (primarily E and S facing aspects). Lots of wind transport filling in the skin track between laps and creating light reactive slabs ~5" deep in places (see photo) primarily out of the west but generally inconsistent in direction.

Region

Northern Gallatin

Location (from list)

Mt Blackmore

Observer Name

Elliot Kiesz
