

Assessing Snowpack Outside of Red Lodge

Date

Wed, 03/19/2025 - 11:15

Activity

Skiing

Location: Mount Maurice

Aspect: N

Elevation: 7,600'

We found a 100cm deep snowpack. In our pit, we got an ECTn13 at 65cm on a melt/freeze crust. We found a layer of facets at the ground that was 5-10cm thick, but we were unable to impact that layer in our tests. We noted other melt freeze crusts and the Feb 4 dirt layer between the new snow on the surface and the layer of facets at the ground.
